FreeSCADA version 2.0.0.6 (preview) got released. This is a bugfix release with several new features:

- MODBUS communication plugin was significantly improved. Now it offers serial MODBUS protocol support and allows writing data back to the device. There were also several improvements in TCP/IP protocol.
- Scripting support for Simulator plugin. It allows defining "computable" channels which use Python interpreter to calculate its value. See examples for more details.
- New common dialog to associate visual element property with project variables. It provides the same look and feel for different binding types.
- Few new examples: "Bouncing ball" and "Coffee machine".
- Several bug fixes for schema editing.

You can get it from [SF download page](#).

If you see a bug, please tell us about it using our [bug tracking system](#).

If you have earlier version of FS2, please uninstall it before proceed with the new install.
